

Rectangle

Directions

Write a Java program that prompts the user for the dimensions of a rectangle, then calculate and print the perimeter and area of the rectangle. Use the following rectangle formulas:

$$\text{Perimeter} = 2L + 2W$$

$$\text{Area} = L * W$$

You will need to use the Scanner class's `nextInt()` method in your implementation.

Sample Output:

```
Enter the Length --> 10
```

```
Enter the Width --> 20
```

```
Perimeter = 60
```

```
Area = 200
```
